GlossNote sample document
This page exists so the anchoring prototype has something to select.

Reading is not moving words from paper into your head.
It is carrying questions back into your own life.

Anchoring is the heart of annotation.
A highlight that cannot survive a restart is only a decoration.

The next paragraph repeats a sentence on purpose.
Anchoring is the heart of annotation.
The second occurrence sits in a different context,
so the resolver has to use the surrounding words to pick the right one.

Zoom in, zoom out, reload the page.
The highlight should return to the same line every time.

A good anchor stores four things:
the quoted text, its neighbours, its position, and the page fingerprint.

Coordinates are normalized to the page,
so changing the window size never moves the mark.

Second page

Try selecting across two lines.
The highlight should cover each line separately.

Try selecting a single word.
Then try selecting a sentence that wraps onto another line.

If the PDF changes, the resolver falls back:
exact fingerprint, then text search, then similarity, then position.

That fallback chain is the part worth testing
before building the library, the database, or the sync layer.

The rest of the product is ordinary engineering.
The anchor is the part that decides whether the notes survive.
